

## About *CeliAction*

The CeliAction Study is a clinical research study designed to evaluate an investigational medication for celiac disease. The study will explore whether the study medication is able to improve the damage in the lining of the intestine caused by ingesting even small traces of gluten.

The study will also evaluate whether the investigational medication improves any symptoms of celiac disease.

**While enrolled in the study, you will be asked to maintain your gluten-free diet.**

If you qualify and choose to take part:

- You will be able to maintain your current gluten-free diet
- You will be provided with all study-related care at no cost
- You may receive compensation for time and travel
- You will receive study-related care by a research team with celiac expertise
- You do not need medical insurance to take part

## See If You *Qualify*

You may qualify for the CeliAction Study if you:

- Have been diagnosed with celiac disease by a healthcare professional
- Are on a gluten-free diet
- Have experienced at least one moderate or severe symptom of celiac disease in the past month

There are other criteria that you must meet to qualify for participation. The study staff will explain the study requirements to you and answer any of your questions.

## About *Clinical Trials*

A clinical trial is a medical research study that evaluates the safety and effectiveness of investigational treatments, medications or devices. To ensure that participants' rights are protected, the study is reviewed and approved by an Institutional Review Board (IRB) or Ethics Committee (EC).

If you volunteer to take part, the research staff will share the study details with you. This information will also be provided in an "Informed Consent Document" that you will review and sign. You may still withdraw from the study at any time after notifying the study staff. Each year thousands of people volunteer to participate in clinical trials.

**As a volunteer in a clinical trial, you may:**

- Participate in a research process that may lead to new treatment options
- Learn new information about your health
- Receive study-related care from qualified physicians

**It is only through clinical research that investigational medications and treatments can be evaluated and – if proven safe and effective – approved for prescription use.**

# About *celiac disease*

Celiac disease is an autoimmune disease that affects susceptible people of all ages. When people with celiac disease eat certain foods, there is a reaction that damages the lining of the small intestine that interferes with their ability to absorb nutrients from food. This reaction is due to the consumption of gluten, a plant protein found in foods like wheat, rye and barley, as well as many everyday products like some medicines and vitamins.

Symptoms of celiac disease may vary from person to person and can affect many different parts of the body, often including:

- Abdominal pain
- Diarrhea
- Bloating
- Joint pain
- Skin rash
- Mouth sores
- Tingling in the legs and feet

Celiac disease can also lead to other health issues such as anemia, weight loss, depression, and dental and bone disorders, among others.

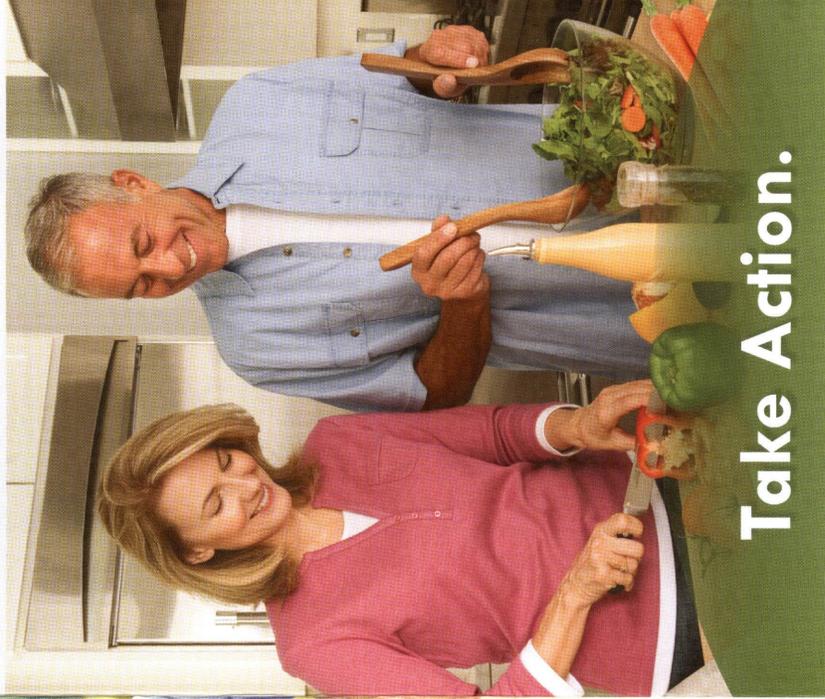

About one in every 100 people in the United States has celiac disease. The only available option for people with this disease is to follow a strict gluten-free diet; there is no prescription medication or cure.
